

TensorFlow Quick Reference Sheet

by

www.TensorFlow.eu

Import TensorFlow:	Neural Networks:
<code>import tensorflow as tf</code>	<code>tf.nn.relu()</code> rectified linear activation function
	<code>tf.nn.softmax()</code> softmax activation function
	<code>tf.nn.sigmoid()</code> sigmoid activation function
	<code>tf.nn.tanh()</code> hyperbolic tangent activation function
	<code>tf.nn.dropout</code> dropout
	<code>tf.nn.bias_add</code> adds bias to value
	<code>tf.nn.all_candidate_sampler()</code> set of all classes
	<code>tf.nn.weighted_moments()</code> returns mean and variance
	<code>tf.nn.softmax_cross_entropy_with_logits()</code> softmax cross entropy
	<code>tf.nn.sigmoid_cross_entropy_with_logits()</code> sigmoid cross entropy
	<code>tf.nn.l2_normalize()</code> normalization using L2 Norm
	<code>tf.nn.l2_loss()</code> L2 loss
	<code>tf.nn.dynamic_rnn()</code> RNN specified by given cell
	<code>tf.nn.conv2d()</code> 2D convolutions given 4D input
	<code>tf.nn.conv1d()</code> 1D convolution given 3D input
	<code>tf.nn.batch_normalization()</code> batch normalization
	<code>tf.nn.xw_plus_b()</code> computes $\text{matmul}(x, \text{weights}) + \text{biases}$
Basic math operations:	High level Machine Learning:
<code>tf.add()</code> sum	<code>tf.contrib.keras</code> Keras API as high level API for TensorFlow
<code>tf.subtract()</code> subtraction	<code>tf.contrib.layers.one_hot_column()</code> one hot encoding
<code>tf.multiply()</code> multiplication	<code>tf.contrib.learn.LogisticRegressor()</code> logistic regression
<code>tf.div()</code> division	<code>tf.contrib.learn.DNNClassifier()</code> DNN classifier
<code>tf.mod()</code> module	<code>tf.contrib.learn.DynamicRnnEstimator()</code> Rnn Estimator
<code>tf.abs()</code> absolute value	<code>tf.contrib.learn.KMeansClustering()</code> K-Means Clustering
<code>tf.negative()</code> negative value	<code>tf.contrib.learn.LinearClassifier()</code> linear classifier
<code>tf.sign()</code> return sign	<code>tf.contrib.learn.LinearRegressor()</code> linear regressor
<code>tf.reciprocal()</code> reciprocal	<code>tf.contrib.learn.extract_pandas_data()</code> extract data from Pandas dataframe
<code>tf.square()</code> square	<code>tf.contrib.metrics.accuracy()</code> accuracy
<code>tf.round()</code> nearest integer	<code>tf.contrib.metrics.auc_using_histogram()</code> AUC
<code>tf.sqrt()</code> square root	<code>tf.contrib.metrics.confusion_matrix()</code> confusion matrix
<code>tf.pow()</code> power	<code>tf.contrib.metrics.streaming_mean_absolute_error()</code> mean absolute error
<code>tf.exp()</code> exponent	<code>tf.contrib.rnn.BasicLSTMCell()</code> basic lstm cell
<code>tf.log()</code> logarithm	<code>tf.contrib.rnn.BasicRNNCell()</code> basic rnn cell
<code>tf.maximum()</code> maximum	
<code>tf.minimum()</code> minimum	
<code>tf.cos()</code> cosine	
<code>tf.sin()</code> sine	
Basic operations on tensors:	Placeholders and Variables:
<code>tf.string_to_number()</code> converts string to numeric type	<code>tf.placeholder()</code> defines placeholder
<code>tf.cast()</code> casts to new type	<code>tf.Variable(tf.random_normal([3, 4], stddev=0.1))</code> defines variable
<code>tf.shape()</code> returns shape of tensor	<code>tf.Variable(tf.zeros([50]), name='x')</code> defines variable
<code>tf.reshape()</code> reshapes tensor	<code>tf.global_variables_initializer()</code> initialize global variables
<code>tf.diag()</code> creates tensor with given diagonal values	<code>tf.local_variables_initializer()</code> initialize local variables
<code>tf.zeros()</code> creates tensor with all elements set to zero	
<code>tf.fill()</code> creates tensor with all elements set given value	
<code>tf.concat()</code> concatenates tensors	
<code>tf.slice()</code> extracts slice from tensor	
<code>tf.transpose()</code> transpose the argument	
<code>tf.matmul()</code> matrices multiplication	
<code>tf.matrix_determinant()</code> determinant of matrices	
<code>tf.matrix_inverse()</code> computes inverse of matrices	
Control Flow:	
<code>tf.while_loop()</code> repeat body while condition true	
<code>tf.case()</code> case operator	
<code>tf.count_up_to()</code> increments ref untill limit	
<code>tf.tuple()</code> groups tensors together	
Logical/Comparison Operators:	
<code>tf.equal()</code> returns truth value element-wise	
<code>tf.not_equal()</code> returns truth value of $X \neq Y$	
<code>tf.less()</code> returns truth value of $X < Y$	
<code>tf.less_equal()</code> returns truth value of $X \leq Y$	
<code>tf.greater()</code> returns truth value of $X > Y$	
<code>tf.greater_equal()</code> returns truth value of $X \geq Y$	
<code>tf.is_nan()</code> returns which elements are NaN	
<code>tf.logical_and()</code> returns truth value of 'AND' for given tensors	
<code>tf.logical_or()</code> returns truth value of 'OR' for given tensors	
<code>tf.logical_not()</code> returns truth value of 'NOT' for given tensors	
<code>tf.logical_xor()</code> returns truth value of 'XOR' for given tensors	
Working with Images:	
<code>tf.image.decode_image()</code> converts image to tensor type uint8	
<code>tf.image.resize_images()</code> resize images	
<code>tf.image.resize_image_with_crop</code> resize image by cropping or padding	
<code>tf.image.flip_up_down()</code> flip image horizontally	
<code>tf.image.rot90()</code> rotate image 90 degrees counter-clockwise	
<code>tf.image.rgb_to_grayscale()</code> converts image from RGB to grayscale	
<code>tf.image.per_image_standardization</code> scales image to zero mean and unit norm	
Working with Data:	
<code>tf.decode_csv()</code> converts csv to tensors	
<code>tf.read_file()</code> reads file	
<code>tf.write_file()</code> writes to file	
<code>tf.train.batch()</code> creates batches of tensors	

<code>with tf.device("/cpu:0"):</code> <code>v = tf.Variable()</code>	pin variable to CPU
<code>with tf.device("/gpu:0"):</code> <code>v = tf.Variable()</code>	pin variable to GPU
<code>sess = tf.Session()</code> <code>sess.run()</code> <code>sess.close()</code>	run session
<code>with tf.Session() as session:</code> <code>session.run()</code>	run session(2)
<code>saver=tf.train.Saver()</code> <code>saver.save(sess,'file_name')</code> <code>saver.restore(sess,'file_name')</code>	Saving and restoring variables.
